

## Questionnaire about Audio cataloguer

- Which web browsers and versions should this software be tested for?
- Should the HTML be adaptable to tablets, phones and other mobile devices?
- Relatedly at what viewport sizes should the browser viewing feature be tested for User Interface/ User experience?
- Which software should the CSV editing feature be tested on?
- It is stated that the tool should not fail for any reason during the working process. How is the “working process” defined here? How is failure defined?
- What versions of Linux and Windows should this application be tested on?
- Is parsing all of the audio formats necessary or can certain formats be left out due to being too complex? Which formats may be too complex to test?
- Should tests of non-English encodings be attempted or can it be let out due to complexity or impossibility?
- The requirements say “No matter how broken an audio file is, the application should either extract necessary data or replace the data with predefined stubs in the output.” What are the predefined stubs?
- Can you provide a sample or description of what the CSV output should be formatted?
- Outside of the background color already described can you provide a sample or description of how the HTML output should appear?
